December 27, 2022

Abstract

The website has a home page that contains some video previews of the videos present in the website. The website then has a page where one can search for a video and if the requested video is listed in database then it is played on the page. There is also an upload page where one can upload a video with a name and description and the same will be listed in the database.

1 Intoduction

VSR Prime is an online video player that displays videos that are already available in the database along with it's name and description. A video player is hardware or software that allows for the playback of video. In the past, most video players were hardware based, like the BetaMax pictured above, but today, most video players are software based, running on phones, browsers, or computers to play back video content.Also the user can upload the videos that are not available in the database to make it available for viewing in the future.

## 2 Output

Figure 1: Main Page
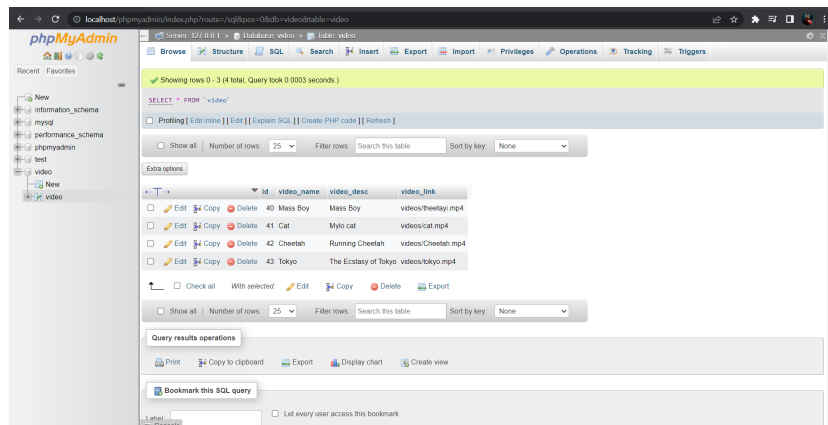

Figure 2: Upload Page

Figure 3: Home Page

Figure 4: Databases

3   Summary

The online video player using php, html, css and javascript was implemented successfully
